

Learning is Liberated!!

Video Tool in HTML5

We just launched our new video tool in HTML5.

Your videos in HTML5 will provide for more stunning and vivid images during playback. Not only that, your video will become available across all new browsers and mobile devices including iPads, mobile phones, and other tablets.

To upload your video

- click on New Module
- choose Screencast, click browse and upload your file
- create a Title of your video
- customize your video module further by adding a Coverpage, Description, Keywords and a Category so learners can easily find your video in the Marketplace

The new video tool allows you to create a Preview of your video that you may want to make available to prospective trainees.

To create a Preview of your video

- Launch the Coggno video editor tool
- Play your video (note: buffering might affect playback time)
- Once buffering is complete, point your cursor to the desired point in your timeline
 - Name the preview, and click "Add Chapter" button
 - Check the box to enable the Preview function once the module is published

To Delete or Change your Preview video

- Point your cursor to the specific timeline, the Preview title appears on the Name field, and click "Delete Chapter"

One last thing, If your video has already been published, and you made any changes to the Preview by adding and deleting, please click on the Apply Changes link to re-publish the video.

Once you are satisfied with the Preview, click Save and your video is ready to be published on Coggnno!

Coggno Makes It Easy!
